Run on:

```
large surface antigen - hepatitis B virus (subtype adr)

Ny Contains: major surface antigen, middle surface antigen

C; Species: hepatitis B virus, HBV

C; Species: hepatitis B virus, HBV

C; Date: 14-Nov-1983 #text_change 09-Jul-2004

C; Accession: A03705; S04569; JQ2107; PQ0608

R; And H, Sasada, R; Igarashi, K.; Sugino, Y.; Nishioka, K.

large surface antigen - hepatitis B virus (isolate 09D09HCC)
NyAlternate names: envelope protein
NyAlternate names: envelope protein
CyContains: major surface antigen; middle surface antigen
CySpecies: hepatitis B virus, HBV
A,Variety: isolate 09D09HCC
CyAccession: T13469
Beequence_revision 13-Aug-1999 #text_change 09-Jul-2004
CyAccession: T13469
Arch. Virol. 143, 2313-2326, 1998
Arch. Virol. 143, 2313-2326, 1998
AyTitle: Hepatitis B virus genomic sequence in the circulation of hepatocellular carcin A;Reference number: Z17684; MUID:99129050; PMID:9930189

The present sequence is encoded by the genome of an isolated strain of Hepatitis B virus designated human Hepatitis B virus (HBV) surface antigen-'S-133 Oon strain (Met to Thr). The viral genome is deposited as ECCC accession numbers P97121501. P97121502 and P97121503. The nucleotide sequence was isolated from hepatocellular carcinoma (HCC). The nucleotide sequence encodes four overlapping proteins, which are a DNA polymerase, a large surface antigen, a core protein, and a transactivating X protein.

The large surface antigen differs from the wild type sequence in that it contains a Thr at position 133 of the wild type sequence instead of a Met. The proteins are used to produce antibodies. The proteins, contains antibodies can be used for detecting the novel HBV strain, The HBV polypeptides can also be used in hepatitis vaccines. The HBV novel strain polypeptides can be used to identify compounds for treating or preventing HBV infection or hepatocellular carcinoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             299 ThrThrProAlaGlnGlyAsnSerThrPheProSerCysCysThrLysProSerAsp 318

```
The invention relates to modified proteins comprising hepatitis B virus (HBV) core antigen (HBCAg) wherein one or more of the four arginine repeats has been deleted and the protein comprising the C-terminal cysteine of HBCAg. The deleted region may be replaced by an epitope from a protein other than HBCAG, in which case the HBCAg acts as a carrier to present the epitope to the immune system. This chimeric protein or its conclete acid is useful as a vaccine or in a method of prophylactic or therapeutic vaccination of the human or animal body, particularly against HBC The nucleic acid encoding the protein may be used in gene therapy or also be used as the basis of a prophylactic vaccine acid may calso be used as the basis of a prophylactic vaccine against a range of disease, e.g. HBV, hepatitis A virus (HAV), hepatitis C virus (HCV), influenza, foot-and-mouth disease, polio, herpes, rabies, acquired communication proteory syndrome (AIDE), dengue fever, yellow fever, malaria, tuberculosis, whooping cough, salmonellosis, typhoid, food poisoning, virus (HBV) adw subtype S antigen
                                                                                                                                                                                           New proteins comprising a modified hepatitis B core antigen, useful as a vaccine in prophylactic or therapeutic vaccination of the human or animal body, particularly against hepatitis B virus infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 ACGACTCCTGCTCAAGGAAACTCTACGTTTCCCTCTTGTTGCTGTACAAAACCTTCGGAC 60

The peptide shows cross reactivity with anti-hepatitis B surface antigen (HBsAG) antiserum. The peptide comprises the "a" epitope of HBsAG, a group specific determinant of HBsAG. It can be used for the diagnosis of hepatitis B virus infection and in vaccines against the virus, particularly in combination with alum as adjuvant and with a myristic acid residue added to the amino terminus of the peptide. This sequence is an analogue of the sequence described in AARSO961. See also in AARSO962-70. (Updated on 25-WAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2 ThrThrProAlaGlnGlyAsnSerWetPheProSerCysCysCysThrLysProThrAsp 21

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to modified proteins comprising hepatitis B virus (HBV) core antigen (HBcAg) wherein one or more of the four arginine repeats has been deleted and the protein comprising the C-terminal cysteine of HBcAg. The deleted region may be replaced by an epitope from a protein other than HBcAg, in which case the HBcAg acts as a carrier to present the epitope to the immune system. This chimeric protein or its nucleic acid is useful as a vaccine or in a method of prophylactic or therapeutic vaccination of the human or animal body, particularly against HBV. The nucleic acid encoding the protein may be used in gene therapy or DNA vaccination protocols. The chimeric protein or its nucleic acid may also be used as the basis of a prophylactic vaccine against a range of diseases, e.g. HBV, hepatitis A virus (HAV), hepatitis C virus (HCV), influenza, foot-and-mouth disease, polio, herpes, rabies, acquired immunodeficiency syndrome (AIDS), denaque fever, yellow fever, malaria, tuberculosis, whooping cough, salmonellosis, typhoid, food poisoning, diarrhoea, meningitis or gonorrhea. The present sequence is Hepatitis B virus (HBV) adw subtype S antigen
                                                                                                                                                                                                                                                                                                                                                                       New proteins comprising a modified hepatitis B core antigen, useful as a vaccine in prophylactic or therapeutic vaccination of the human or animal body, particularly against hepatitis B virus infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 ACGACTCCTGCTCAAGGAAACTCTACGTTTCCCTCTTGTTGCTGTACAAAACCTTCGGAC 60

```
The peptide shows cross reactivity with anti-hepatitis B surface antigen (HBsAG) antiserum. The peptide comprises the "a" epitope of HBsAg, a group specific determinant of HBsAg. It can be used for the diagnosis of hepatitis B virus infection and in vaccines against the virus, particularly in combination with alum as adjuvant and with a myristic an analogue of the sequence described in AARSO961. See also in AARSO962-70. (Updated on 25-WAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       for use in diagnosis or vaccines for hepatitis B virus \cdot oligomers of an epitope sequence of hepatitis B surface
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Molecular presentation, FHV; virion-like particle, capsid protein, capsomer, RNA-2 gene, epitope, HBV; vaccine.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          8
                                                                                                                                                                                                                                                                                                                   The peptide shows cross reactivity with anti-hepatitis B surface antigen (HBsAG) antiserum. The peptide comprises the "a" epitope of HBsAG, a group specific determinant of HBsAG. It can be used for the diagnosis of hepatitis B virus infection and in vaccines against the virus, particularly in combination with alum as adjuvant and with a myristic acid residue added to the amino terminus of the peptide. Analogues of this sequence are described in AAR50962-70. (Updated on 25-WAR-2003 to correct PN field.)

                                                                                                                                                     ď
                                                                                        The B-cell epitope (AAR94433) of the hepatitis B virus surface protein may be inserted into the outward-directed [1, 12, 13, 12 or 13 loop of the Flock House virus capaid protein (AR88755). The capsid protein provides a conformationally suitable location for this (or other, see AAR94430-32 and AAR94434-45) heterologous peptides. A molecular presentation system is obtd. The FHV recombinant capsomer can be expressed in B. coli. Alternatively, expression in insect cells using a baculovirus vector results in prodn. of mature virus-like particles. A beautic complex compliation (alpha-2M) having an inteact bain cuttured an analysis of a lapha-2-macroglobulin (alpha-2M) having an inteact bait region is claimed, in which the biomolecule is covalently bound to an amino acid residue of a clawed thiol ester of the alpha-2M, the amino acid residue being a glutamyl residue and/or a cysteinyl residue. Preparation of the complex comprises activation of alpha-2M with a nucleophilic compound followed by incubation with the biomolecule at elevated temperature. Covalent compound to from inteact biomolecule is the effect without use of a protease. The obtained complex may be used as an antigen for stimulating fimune response, e.g. in the form of a vaccine. Enhanced presentation of the biomolecule is provided, especially for those antigens which are poorly immunogenic. Reduction of immunodominance of particular epitopes is also provided. Preferably the biomolecule is an HIV antigen or a hepatitis virus antigen, or a peptide, fragment, hybrid or chimeric bepatitis virus antigen, or a peptide, fragment, hybrid or chimeric compatitis peptide which may be used in the complex. It represents the pattitis peptide which may be used in the complex. It represents the confidence of the confidence of the pattitis peptide which may be used in the complex. It represents the confidence of the process of the pattitis beyond the standardise OS field)
                                                              A stable complex comprising at least one intact biomolecule and activated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        immune response; macrophage; tumour; human immunodeficiency virus; HIV; cytostatic; antimicrobial; alpha2M; anti-HIV; virucide; HBsAg.

```
The information retained to a stable complete Complete Complete with a nucleophilic group which is covalently bound to activated alpha-2-macroglobulin (alpha2M) with an intact bait region. The stable complete is useful for enhancing host immunocompetence and for preparing vaccines for preventing and treating disease states. It is useful for increasing immune response to a particular antigen, and for suppressing immune response to a particular antigen. It is most preferably useful for administering antigens recognised by the macrophage in view of the existence on the macrophage of receptors for alpha2M. It is useful for treating cancer or infection, where the isolated protein is derived from tumour, abnormal cells or infectious organism, and this protein can be used as an antigen and prepared in alpha2M complex which statement in need of such treatment. It can also be used for inducing immune response against human immunodeficiency virus (HTV) antigens, and chequities virus antigens. The present sequence is Hepsatities b virus curface antigen (HBBAA) peptide used in the exemplification of the unvention. (Updated on 06-AUG-2003 to correct OS field.)

The insert encoding this epitope was ligated into the NheI restriction site of plasmid pPV-Nhe to recreate the NheI sites which code for Ala-Ser residues flanking the epitope. The recombinant plasmid was transformed into E.coli strain XL-I Blue. Positive clones were cultured to high density in nutrient broth and induced to express chimaeric protein comprising the desired epitope by addition of IPTG. (Updated on 25-MAR-2003 to correct PR field.)

```

Claim 3; SEQ ID NO 15; 61pp; German.

```
This sequence represents novel oligo- and poly-peptides that are variants of the hepatitis B surface antigen (HBsAg). HBV strain HBDD5 was isolated from a patient with inflammation of the liver but an atypical reaction pattern of hepatitis markers. PCR amplification and sequencing indicated the 5 specified mutations in the 8 gene, relative to adw wild-type. These comparations and laused amino acid variations: 4 in the a-determinant region and the other close to it at residue 181. The products of the invention are used to detect specific antibodies of the products of primers for detecting hepatitis B virus (HBV) nucleic acid, as immunogens and antibodies (Ab) raised against HBSAg are used for detecting HBSAg including use in vaccination, diagnosis and screening of donated blood. The antibodies do not bind, or bind much less strongly, to the HBSAg from virus of genotype A, subtype adw. This sequence represents a fragment of HEPATITUS B virus (HBSAG) corresponding to residues 115-

New oligo- or poly-peptide variants of hepatitis B surface antigen, useful for diagnosis of, and vaccination against, hepatitis infection, derived from strain HDB05, also related nucleic acid and antibodies.

```
This sequence represents novel oligo- and poly-peptides that are variants of the hepatitis B surface antigen (HBBAG). HBV strain HBDO5 was isolated from a patient with inflammation of the liver but an atypical reaction pattern of hepatitis markers. PCR amplification and sequencing indicated the 5 specified mutations in the 8 gene, relative to adw wild-type. These mutations all caused amino acid variations: 4 in the a-determinant region of the other close to it at residue 181. The products of the invention have virucide, hepatotropic and antilnifiammatory activity. The products of the invention are used to detect specific antibodies, as immunogens and antibodies (Ab) raised against HBBAG are used for detecting HBBAG. Including use in vaccination, diagnosis and screening of donated blood. The antibodies do not bind, or bind much less strongly, to the HBBAG from virus of genotype A, subtype adw. This sequence represents a fragment of HBBAGITUS.

                                   This sequence represents novel oligo- and poly-peptides that are variants of the hepatitis B surface antigen (HBsAg). HBV strain HBD05 was isolated from a patient with inflammation of the liver but an atypical reaction pattern of hepatitis markers. PCR amplification and sequencing indicated the S specified mutations in the S gene, relative to adw wild-type. These mutations all caused amino acid variations: 4 in the a-determinant region and the other close to it at residue 181. The products of the invention have virucide, hepatotropic and antiinflammatory activity. The products of the invention are used to detect specific antibodies, as probes or primers for detecting hepatitis B virus (HBV) nucleic acid, as immunogens and antibodies (Ab) raised against HBsAg are used for detecting HBsAg including use in vaccination, diagnosis and screening of donated blood. The antibodies do not bind, or bind much less strongly, to the HBsAg from virus of genotype A, subtype adw. This sequence represents a fragment of Hepatitus B virus surface protein (HBsAg) corresponding to residues 111-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                New oligo- or poly-peptide variants of hepatitis B surface antigen, useful for diagnosis of, and vaccination against, hepatitis infection, derived from strain HDB05, also related nucleic acid and antibodies.

This sequence represents novel oligo- and poly-peptides that are variants of the hepatitis B surface antigen (HBBAG). HBV strain HBDO5 was isolated from a patient with inflammation of the liver but an atypical reaction pattern of hepatitis markers. PCR amplification and sequencing indicated the 5 specified mutations in the S gene, relative to adw wild-type. These mutations all caused amino acid variations: 4 in the a-determinant region of the other close to it at residue 181. The products of the invention have virucide, hepatotropic and antilnifiammatory activity. The products of the invention are used to detect specific antibodies, as probes or primers for detecting hepatitis B virus (HBV) nucleic acid, as immunogens and antibodies (Ab) raised against HBAG are used for detecting HBBAG including use in vaccination, diagnosis and screening of donated blood. The antibodies do not bind, or bind much less strongly, to the HBBAG from virus of genotype A, subtype adw. This sequence represents a fragment of HBPAG trus genotype A surface protein (HBBAG) a-determinant of corresponding to residues 101-170.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       44
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New oligo- or poly-peptide variants of hepatitis B surface antigen, useful for diagnosis of, and vaccination against, hepatitis infection, derived from strain HDB05, also related nucleic acid and antibodies.

Disclosure; Fig 6; 61pp; German.

This sequence represents novel oligo- and poly-peptides that are variants of the hepatitis B surface antigen (HBBAQ). HBV strain HBDD5 was isolated from a patient with inflammation of the liver but an atypicial reaction pattern of hepatitis markers. PCR amplification and sequencing indicated the 5 specified mutations in the S gene, relative to adw wild-type. These mutations all caused amino acid variations: 4 in the a-determinant region and the other close to it at residue 181. The products of the invention have virucide, hepatotropic and antiinflammatory activity. The products of the invention are used to detect specific antibodies as probes or primers for detecting hepatitis B virus (HBV) nucleic acid, as immunogens and antibodies (Ab) raised against HBSAQ are used for detecting HBSAQ including use in vaccination, diagnosis and screening of donated blood. The antibodies do not bind, or bind much less strongly, to the HBSAQ from virus of genotype A, subtype adw. This sequence represents a fragment of the Hepatitus B virus wild-type HBD S surface protein (HBSAQ) S protein corresponding to residues 101-170.
